

[illegible]

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher for the 10-trial condition than for the 5-trial condition. The number of correct responses was significantly higher for the 10-trial condition than for the 5-trial condition. The number of correct responses was significantly higher for the 10-trial condition than for the 5-trial condition.

The diagram illustrates a network topology. A central switch is connected to four edge routers, each represented by a small icon with a triangle and a circle. The connections are shown as lines between the central switch and each edge router.
